

February 2007: new version with better variable names!

bun64 - an absolutely teeny method for decoding base64 in any context...

This PDF is just for distributing the data. To unpack just decode the base64 at the end of this file (or more technically "in-between the ends of files?").

Once you've done this, you can file in the code to enable you to do all this automatically. Probably this software is still buggy in two fairly major ways: 1) it searches for its magic string at the beginning, and doesn't currently search backwards; 2) it still makes use of "FileStream fileName: " (but as this works on my systems, I see no real reason to change my coding methods. I note it just in case this causes problems in newer Squeaks.)

...yours humbly,

Russell N. Hyer
Squacker
